

USER GUIDE

Jobflow User Manual

A visual, practical guide to using the application tracker

Documentation package

Prepared from the Jobflow V3 codebase and current product direction.

Jobflow is a Django-based job application tracking workspace designed to turn scattered applications into a clear, actionable pipeline.

Contents

Section	What it covers
What Jobflow is	Purpose and product overview
First visit	Landing page and Demo Mode
Account	Registration and login
Pipeline	Statuses, drag-and-drop, search
Applications	List, filters, CRUD
Insights	Dashboard and upcoming actions
Privacy	Per-user data isolation
Interview demo	Suggested walkthrough

1. What Jobflow is

Jobflow is a personal workspace for managing job applications from first submission through interviewing, offers, rejection, or withdrawal. It combines a Kanban-style pipeline, a searchable application table, and an insights dashboard.

V3 also introduces a public landing page and a read-only Demo Mode, so a visitor can understand the product before creating an account.

2. First visit

A visitor starts at the public landing page. The page presents the product, its value proposition, and clear paths to explore the demo or create/sign into a workspace.

UI preview: public landing page (illustrative representation based on the V3 UI).

3. Explore Demo Mode

Open `/demo/` to see a safe, read-only sample workspace. The demo uses fictional records and does not query a user's private application data.

Portfolio benefit: an interviewer can explore the product without receiving access to personal job-search information.

4. Account

- Register with username, email, and password.
- After registration, Django logs the new user in automatically.
- Returning users use Login.
- Authenticated users enter the application area under `/app/`.

5. Pipeline

The Pipeline is the visual center of Jobflow. Applications are grouped into Applied, Interviewing, Offer, Rejected, and Withdrawn.

UI preview: Pipeline board and application cards.

Move and search

- Drag cards between columns using HTML5 drag-and-drop.
- Use each card's status selector as an accessible alternative.
- JavaScript sends the new status with POST; Django validates it and saves it.
- Board search filters company and role instantly.

6. Applications list

The Applications page provides a table view with status filters and instant browser-side search. Each record can be edited or deleted.

7. Add / edit

The form captures company, role, status, date applied, next-action date, job URL, and notes. The owner is assigned server-side.

8. Insights

The dashboard shows status counts, percentages, a status chart, upcoming actions in the next 14 days, and recently added applications.

UI preview: Insights dashboard (illustrative representation based on the V3 UI).

9. Delete safely

Deletion uses a confirmation page followed by POST. The backend again scopes the application lookup to the signed-in owner.

10. Quick reference

Page	Purpose
/	Public landing page
/demo/	Read-only demo with fictional data
/login/	Authentication
/register/	Create account
/app/	Pipeline board
/app/dashboard/	Insights
/app/applications/	Application list

11. Best interviewer demo sequence

- Open the landing page.
- Click View live demo.
- Explain the five-stage workflow.
- If desired, create an account and add a sample application.
- Move it through statuses and show Insights.
- Use the README flowchart and deep-dive PDF for technical context.

12. Privacy

Every Application belongs to a Django User. Private queries and object lookups are scoped to `request.user`, forming the core data-isolation rule.
